

AGENTIC SOFTWARE DELIVERY AND GOVERNED EXECUTION

Give Noetfield a goal. It structures the work, runs the team, checks the result, and keeps the evidence.

Noetfield is an agentic workspace for turning a scoped request into planned, executed, checked, revisioned, and deployable work. AI Motors provide the governed execution layer behind the product. The verifier, not the model, decides what passes.

The product surface

- Noetfield App (live alpha) — projects, goals, a Front Person, task state, artifacts, previews, revisions, and build records. app.noetfield.com
- Runways — workflow classes that define how a result qualifies: inputs, acceptance criteria, human decision points, and the receipt each run leaves behind.
- Deterministic API (developer preview) — schema-valid-or-fail structured completions under deterministic controls, with workspace keys and receipts.
- AI Motors — the execution runtimes underneath: explicit authority before action, bounded workers, separate verification, bounded repair, documented safe stops.
- TrustField — Noetfield Systems Inc.'s regulated-operations and compliance product vertical: FINTRAC case operations with public synthetic demonstrations at trustfield.ca.

How a request becomes evidenced work

State a goal > plan, roles, and budget > the team runs inside the envelope > separate checks, bounded revision, safe stop > ship with a receipt. At every step there is a control, and a defined behavior when the step fails.

Stage, stated plainly

Status: live alpha, founder-operated. First-party evidence is published at noetfield.com/proof. No external customers or revenue yet. A receipt is not certification.
